How Botox works

Cosmetic injections are popular techniques used in aid to temporarily eliminate wrinkles. Most wrinkles are caused by excessive muscle contraction in the forehead and around the eye, forming frown lines and crows feet. Botox blocks signals from the nerves to the muscles, the injected muscle can no longer contract which causes wrinkles to relax and soften giving a natural look.

How the procedure is performed

The procedure takes only a few minutes and requires no anaesthesia. Botox is injected with a fine needle into specific muscles. It generally takes 3-7 days to take full effect.

Client confidentiality is always respected.

How long does it last

The effects from Botox last 3-6 months. As muscle action gradually returns the lines and wrinkles begin to re-appear and need to be re-treated.

Price guide
